Summary

A critical check list of Bulgarian spiders is presented, together with a comprehensive review of published data. Altogether 910 species based on 173 publications are listed, derived from a total of 7,222 records. Many changes in nomenclature have been made as a result of taxonomic revisions and the re-examination of existing collections. The following new synonyms are proposed: *Linyphia phrygiana* var. *pirini* Drensky, 1921 = *Pityohyphantes phrygianus* (C. L. Koch, 1836), *Hogna (Tarentula) macedonica* Drensky, 1929 = *Hogna radiata* (Latreille, 1817), *Prosthesima bitolensis* Drensky, 1929 = *Zelotes gracilis* (Canestrini, 1868), *Comaroma ressenensis* Drensky, 1929 = *Spermophora senoculata* (Dugès, 1836), and *Cyclosa strandjae* Drensky, 1915 = *Cyclosa conica* (Pallas, 1772).

Introduction

The first known contributions concerning the Bulgarian spider fauna were made by Pavesi (1876) and Hristovich (1892). Listing the spider fauna was continued by Drensky (1909, 1910, 1911a, b, 1912, 1913, 1915a, b, 1921, 1924, 1925, 1926, 1927a, b, 1929, 1930, 1931a, b, c, 1932, 1933, 1934a, b, 1936a, b, c). Drensky (1936a) published the only catalogue of the spiders on the Balkan Peninsula, where 624 species from Bulgaria were reported. It is now 65 years since that publication, and during this time a considerable number of species have been added to the Bulgarian spider list. Many changes in nomenclature have also been made as a result of taxonomic revisions and the re-examination of existing collections.

Material and methods

The present check list is based on the critical incorporation of all available published records on the distribution of spiders in Bulgaria. All taxonomic changes arising as a result of revisions of the available parts of Drensky's collection are also included. Drensky (1936a) included all records up to 1936. This check list contains a comprehensive list of all publications on Bulgarian spiders published between 1876 and 2000.

The taxonomic names follow the nomenclature given in Platnick (1989, 1993, 1998). To clarify the complicated synonymy of some species the catalogues of Roewer (1942, 1955a, b), Brignoli (1983) and Prószyński (1990) have been used. In many cases the original species description and taxonomic revision papers have also been used.

There is a wide range of quality of data in the early publications, which affects the validity of records. The main shortcomings and paucity of records published before 1960 (just 55 titles) are due to the obsolete and

unusable taxonomic nomenclature and in some cases to misidentifications. In this respect, all published and unpublished results of revisions of the material in Drensky's collection have been used in the present check list.

Results

Species composition

A total of 910 spider species from 40 families has been established from a critical review of 173 publications. Forty-eight newly discovered species from Bulgaria, described mainly by Bulgarian araneologists, are currently regarded as valid. Drensky described many new taxa, but only 18 of them are still regarded as valid. The rest of the newly described taxa were due to the research of Deltshev (20), Buchar (2), Dimitrov (2), Dimitrov & Lazarov (2), Dumitresco (1), Miller (1), Wunderlich (1) and Deltshev & Dimitrov (1).

Taxonomic changes

All taxonomic changes concerning the taxa first described from Bulgaria are presented in Table 1, including 5 new synonyms, 1 nomen nudum and 1 nomen dubium. The type material of *Linyphia phrygiana* var. *pirini* Drensky, 1921 (= *Pityohyphantes phrygianus* (C. L. Koch, 1836), type material in good condition), *Hogna (Tarentula) macedonica* Drensky, 1929 (= *Hogna radiata* (Latreille, 1817), type material of immature female), *Prosthesima bitolensis* Drensky, 1929 (= *Zelotes gracilis* (Canestrini, 1868), type material in good condition) was found and revised. Unfortunately, the type material of *Comaroma ressenensis* Drensky, 1929, *Cyclosa strandjae* Drensky, 1915 and *Echemus babunaensis* Drensky, 1929 was not found. Nevertheless, the description and figures of *Comaroma ressenensis* fit well with *Spermophora senoculata* (Dugès, 1836). Dimitrov (1999) presents a drawing of the epigyne of a subadult female of *Cyclosa conica* (Pallas, 1772), which is quite similar to those given by Drensky (1915) for *C. strandjae*. The description and figures of *Echemus babunaensis* Drensky, 1929 correspond well with the genus *Zelotes*. *Araneus riloensis* Drensky, 1934 is here regarded as a nomen nudum, and *Heliophanus flavipes* var. *nigripes* Jurinitch & Drensky, 1917 (immature specimen) as a nomen dubium. One of the main problems in completing this critical check list is the incompleteness of Drensky's collection.

Misidentifications

The revision of Drensky's collection brought to light some corrections in the list of the species resulting from misidentifications (Table 2).

Incorrect data on distribution

Another problem is caused by the species reported by Drensky (1936a) from single localities, but which

are not present in his collection and which have not been confirmed subsequently. Some of them are regarded as incorrect records judging by recent data on the distribution of these species (Table 3).

Uncertain records (included in check list)

Some other species are accepted with reservations in the present check list. These species are listed here to indicate that some caution should be paid when accepting the record as valid for Bulgaria.
